\* (1736) Bridges of Konigsberg (today's Kaliningrad): walk all 7 bridges without crossing a bridge twice.

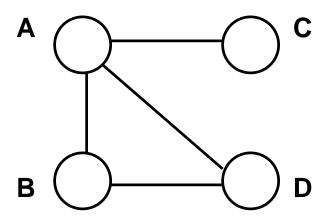

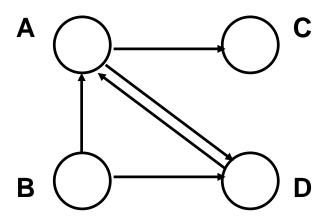

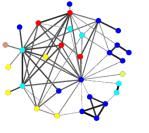

- **Graph theory** is the study of *graphs*, mathematical structures used to model pair wise relations between objects from a certain collection.
- \* A "graph" in this context refers to a collection of vertices or 'nodes' and a collection of edges that connect pairs of vertices.

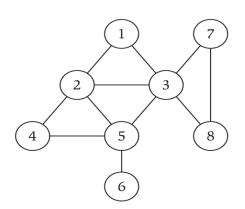

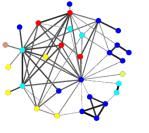

**\*Graph** — mathematical object consisting of a set of:

- \*V =**nodes** (vertices, points).
- \*E = edges (links, arcs) between pairs of nodes.
- **\* Graph size** parameters: n = |V|, m = |E|

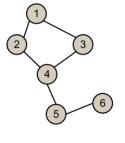

```
V = \{ 1, 2, 3, 4, 5, 6, 7, 8 \}
E = \{ \{1,2\}, \{1,3\}, \{2,3\}, \{2,4\}, \{2,5\}, \{3,5\}, \{3,7\}, \{3,8\}, \{4,5\}, \{5,6\} \}
n = 8
m = 11
```

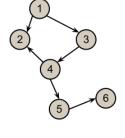

\* A **subgraph** of a graph *H* is a graph whose vertex set is a subset of that of *G*, and whose adjacency relation is a subset of that of *G* restricted to this subset.

1) Network motifs

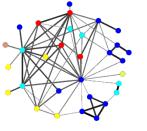

#### **Degree Distribution (Undirected)**

#### **Degree distribution (undirected)**

\* The **degree** of a node in a network is the number of connections it has to other nodes.

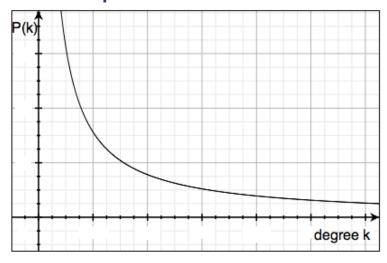

$$N(x)=5$$

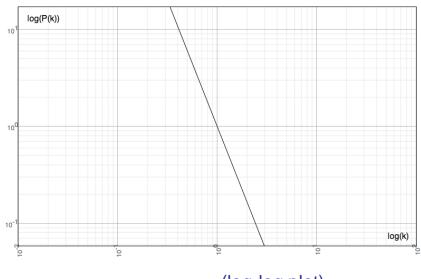

- \* The **degree distribution** P(k) gives the probability that a selected node has exactly k links
- \* P(k) is obtained by counting the number of nodes N(k) with k = 1, 2,... links and dividing by the total number of nodes N.

#### **Degree Distribution (Undirected)**

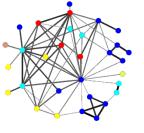

#### \* Example:

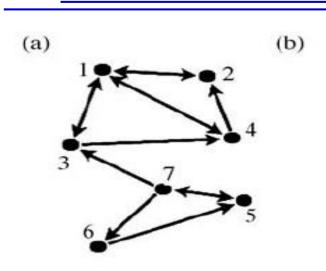

(log-log plot)

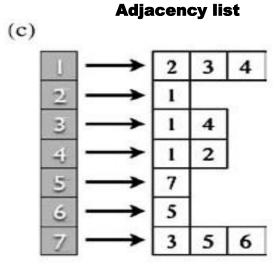

- ► Here P(k) ~  $k^{-\gamma}$ , where often 2 ≤ γ < 3. This is a *power-law* distribution.
- Networks with power-law degree distributions are called scale-free networks.
- Most of the nodes are of low degree, but there is a small number of highly-linked nodes.

#### **Degree Distribution (Directed)**

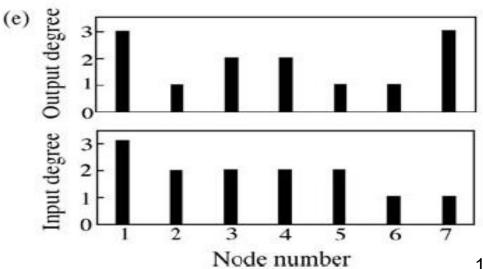

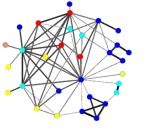

| Adjacency Matrix |   |   |   |   |   |   |   |  |  |  |  |  |  |
|------------------|---|---|---|---|---|---|---|--|--|--|--|--|--|
|                  | 1 | 2 | 3 | 4 | 5 | 6 | 7 |  |  |  |  |  |  |

| (d)  |  |
|------|--|
| Path |  |

|   | Ū | 2 | 3 | 4 | 5 | 6  | 7   |
|---|---|---|---|---|---|----|-----|
| U | 2 | 1 | 1 | 1 | 8 | 00 | 000 |
| 2 | 1 | 2 | 2 | 2 | 8 | 8  | ∞   |
| 3 | 1 | 2 | 2 | 1 | œ | œ  | œ   |
| 4 | 1 | 1 | 2 | 2 | 8 | ∞  | 000 |
| 5 | 3 | 4 | 2 | 3 | 2 | 2  | 1   |
| 6 | 4 | 5 | 3 | 4 | 1 | 3  | 2   |
| 7 | 2 | 3 | 1 | 2 | 1 | 1  | 2   |

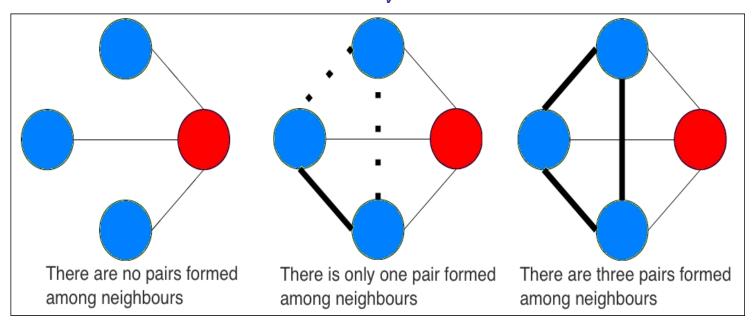

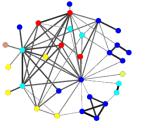

#### Clustering Coefficient (Local)

#### clustering coefficient $C_{\nu}$ of a node $\nu$

$$C_v = 2E_{N(v)}/k_v(k_v-1)$$

 $C_v$  can be viewed as the probability that two neighbors of v are connected. Thus  $0 \le C_v \le 1$ .

#### Clustering Coefficient (Local)

#### Example:

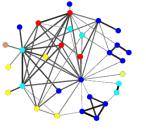

$$C_v = 2E_{N(v)}/k_v(k_v-1)$$

- $|E_{N(v)}| = 3$
- $k_v(k_v-1)/2=4(4-1)/2=6$
- $\triangleright$  Therefore  $C_v = 3/6 = 1/2$

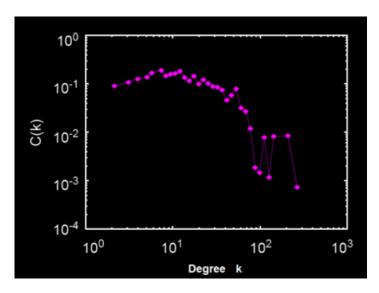

( edges in *N(v)* ) ( Maximum Possible Edges in N(v) )

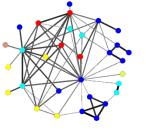

viaximum Possible Euges in N(v)

#### **Clustering Coefficient (Local)**

- \* Average clustering coefficient, C, of a network is the average  $C_v$  over all the nodes  $v \in V$ .
- \* Clustering spectrum, C(k) is the distribution of the average clustering coefficients of all nodes of degree k in the network, over all k.

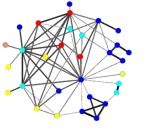

#### **Clustering Coefficient (Global)**

- \* The global gives an overall indication of the clustering in the network, whereas the local gives an indication of the embeddedness of single nodes.
- The global clustering coefficient is based on triplets of nodes.
- \* A triplet is three nodes that are connected by either two (open triplet) or three (closed triplet) undirected ties.
- \* The global clustering coefficient is the number of closed triplets (or 3 x triangles) over the total number of triplets (both open and closed).

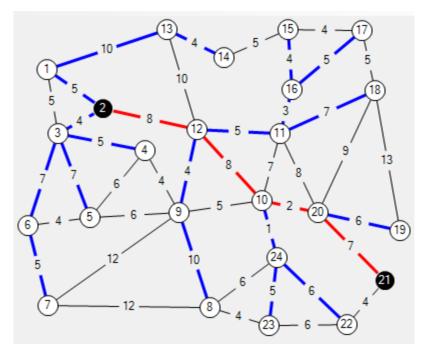

$$C = \frac{3 \times \text{number of triangles}}{\text{number of connected triplets of vertices}} = \frac{\text{number of closed triplets}}{\text{number of connected triplets of vertices}}.$$

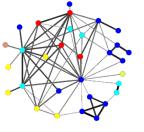

A triangle consists of three closed triplets, one centered on each of the nodes.

#### Distance, Shortest Path, Network Diameter

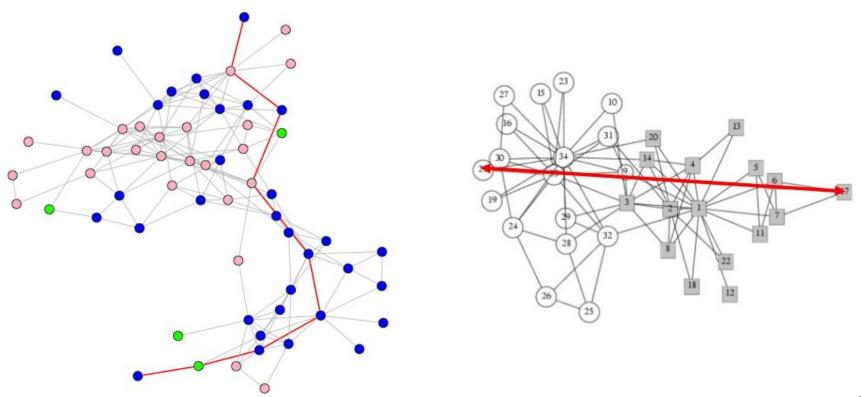

- \* <u>Distance</u> between two nodes is the smallest number of links that have to be traversed to get from one node to the other.
- \* Shortest Path is the path that achieves that distance.

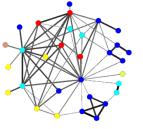

#### Distance, Shortest Path, Network Diameter

\* <u>Network Diameter</u> is the average of shortest path lengths over all pairs of nodes in a network.

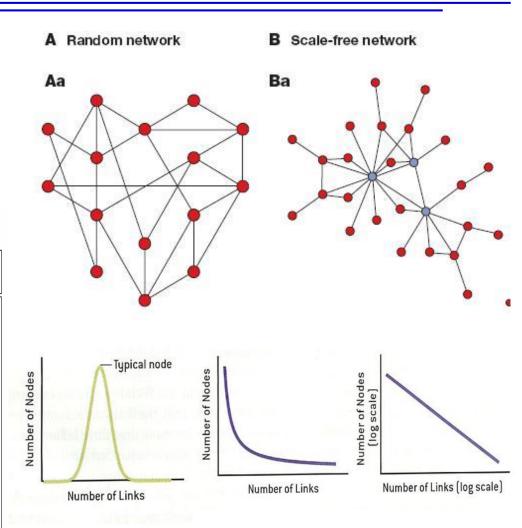

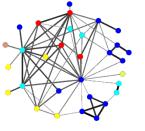

#### Scale-free vs Random

# A scale-free network is a network whose degree distribution follows a power law P (k) ~k-7

Clustering coefficients, C, for a number of different networks; n is the number of node, z is the mean degree.

| Network                    | n         | z     | C        | C for        |
|----------------------------|-----------|-------|----------|--------------|
|                            |           |       | measured | random graph |

#### **Small World**

a small-world network is defined to be a network where the typical distance *L* between two randomly chosen nodes (the number of steps required) grows proportionally to the logarithm of the number of nodes *N* in the network.

 $L \propto \log N$ 

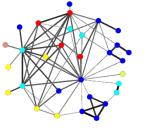

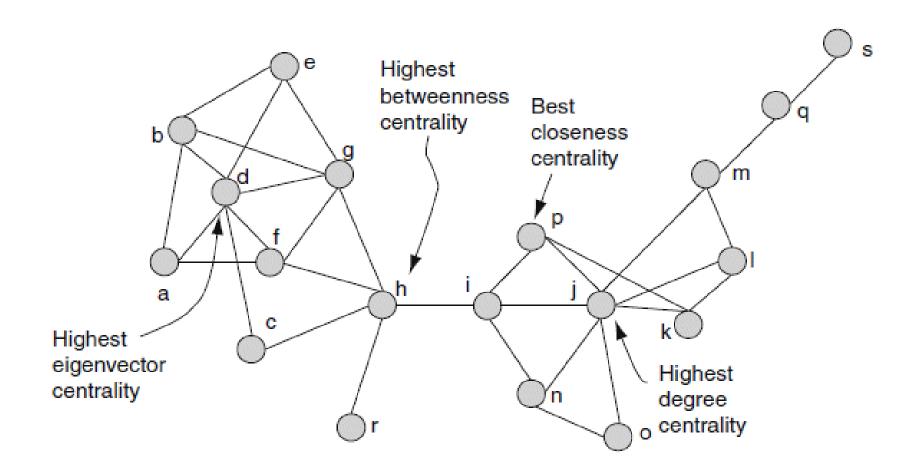

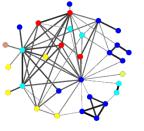

# **Centrality**

- \* Rank nodes according to their "topological importance"
  - Degree
  - \* Closeness
  - Betweenness
  - # Eigenvector
  - \* BottleNeck
  - Clustering coefficient
  - Stress
  - Radiality
  - \* EcCentricity
  - **\*** EPC
  - # MNC
  - \* DMNC
  - **#** MCC
  - # ...

# Centrality

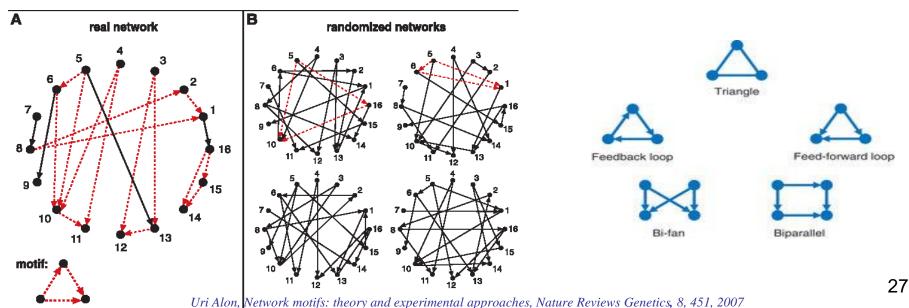

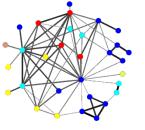

#### **Network Motifs**

**Network motifs** are connectivity-patterns (sub-graphs) that occur much more often than they do in random networks.

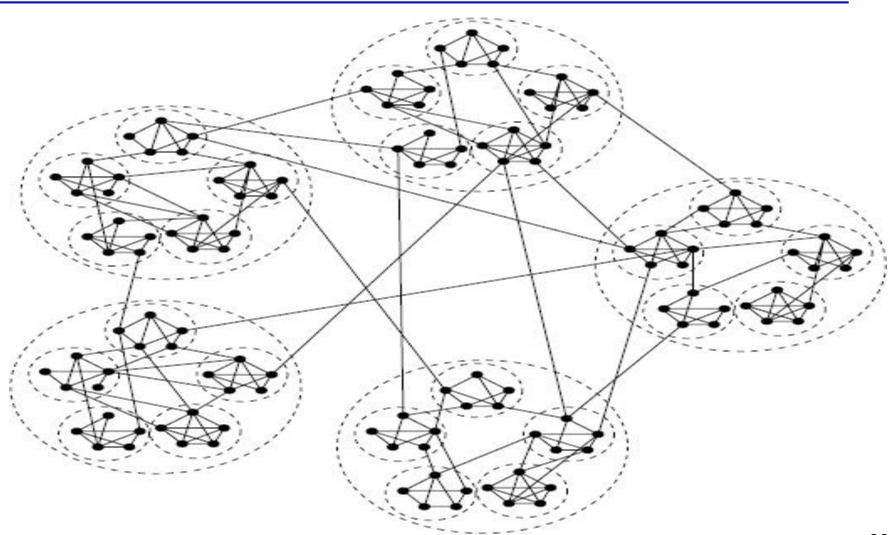

These small circuits can be considered as simple building blocks from which the network is composed.

This idea was first presented by <u>Uri Alon</u> and his group when network motifs were discovered in the gene regulation network of the bacteria E. coli.

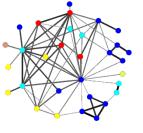

#### **Network Clustering**

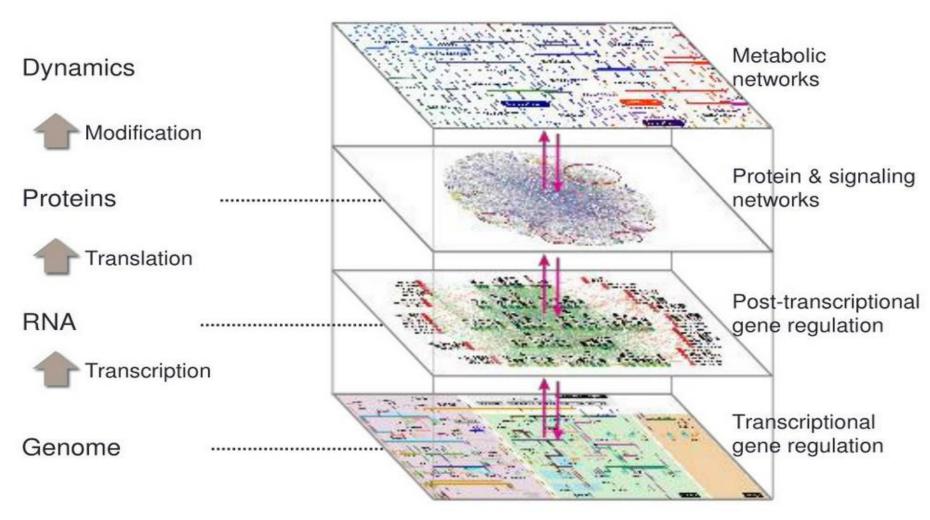

# **Graph Theory in Biological Networks**

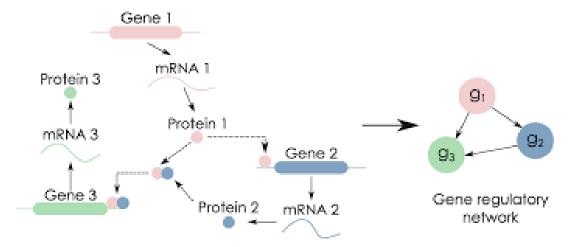

#### Graph Theory in Biological Networks

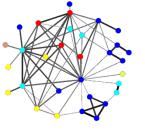

#### Gene Regulatory Network (GRN)

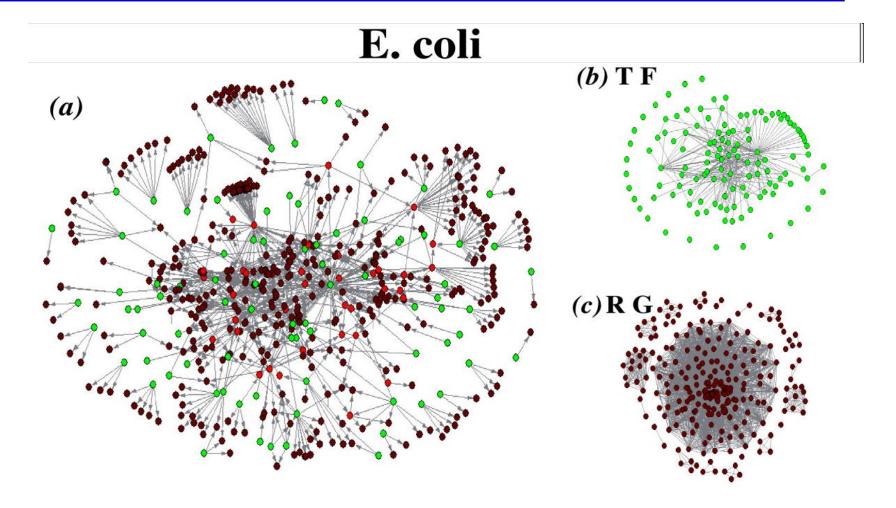

- Nodes correspond to genes
- Directed edges correspond to interactions through which the products of one gene affect those of another
  - Protein-protein, protein-DNA and protein-mRNA interactions

\* Transcription factor X (protein product of gene X) binds regulatory DNA regions of gene Y to regulate the production rate (i.e., stimulate or repress transcription) of protein Y

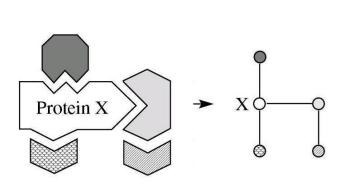

#### Gene Regulatory Network (GRN)

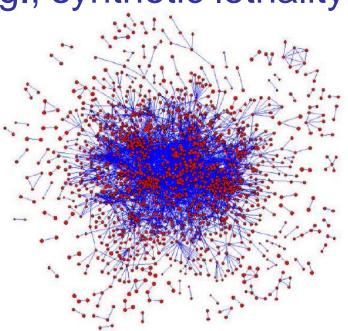

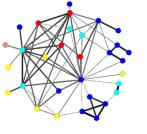

#### Protein-Protein Interaction (PPI) Network

- \* A protein-protein interaction (PPI) usually refers to a physical interaction, i.e., binding between proteins
- \* Can be other associations of proteins such as functional interactions e.g., synthetic lethality

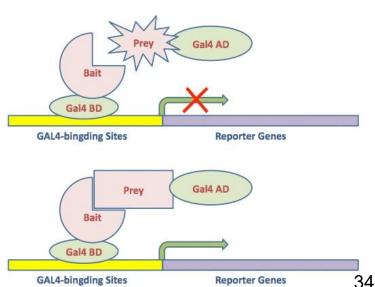

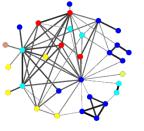

#### Protein-Protein Interaction (PPI) Network

- \* The premise behind the test is the activation of downstream reporter gene by the binding of a transcription factor onto an upstream activating sequence (UAS).
- \* For two-hybrid screening, the transcription factor is split into two separate fragments, called the DNA-binding domain (DBD or often also abbreviated as BD) and activating domain (AD).

The BD is the domain responsible for binding to the UAS and the AD is the domain responsible for the activation of transcription.

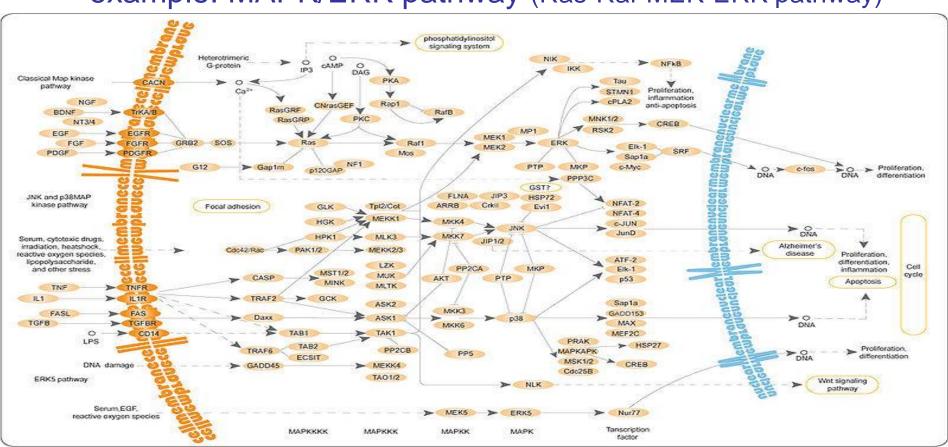

The Y2H is thus a protein-fragment complementation assay.

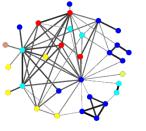

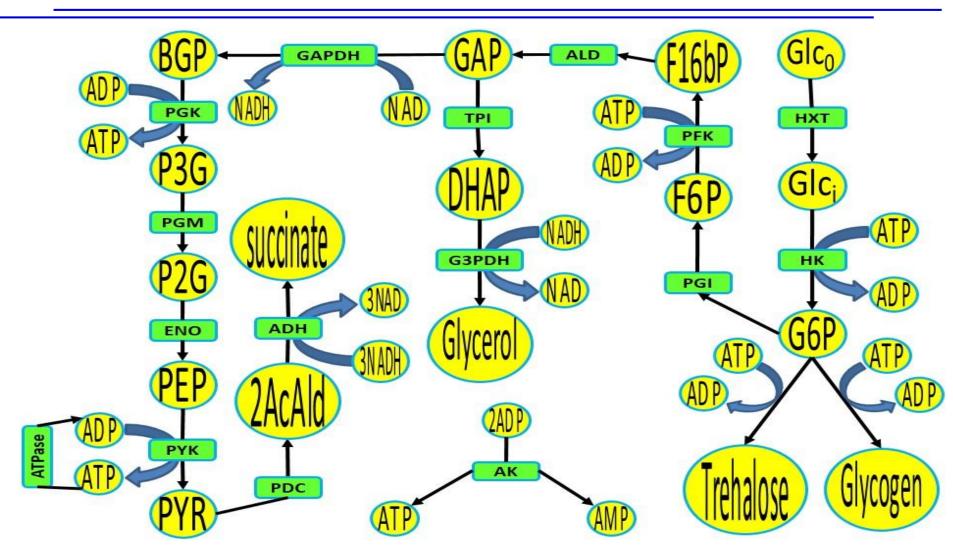

# Signaling network

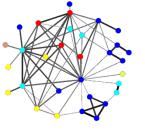

Nodes are proteins and edges are directed example: MAPK/ERK pathway (Ras-Raf-MEK-ERK pathway)

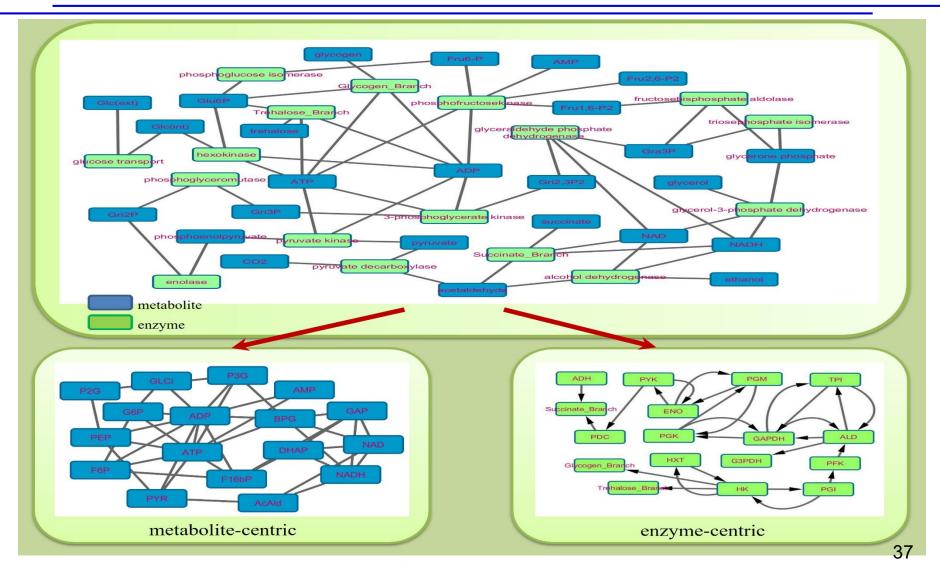

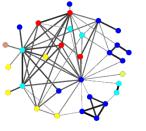

#### Metabolic Network-Example: Glycolysis

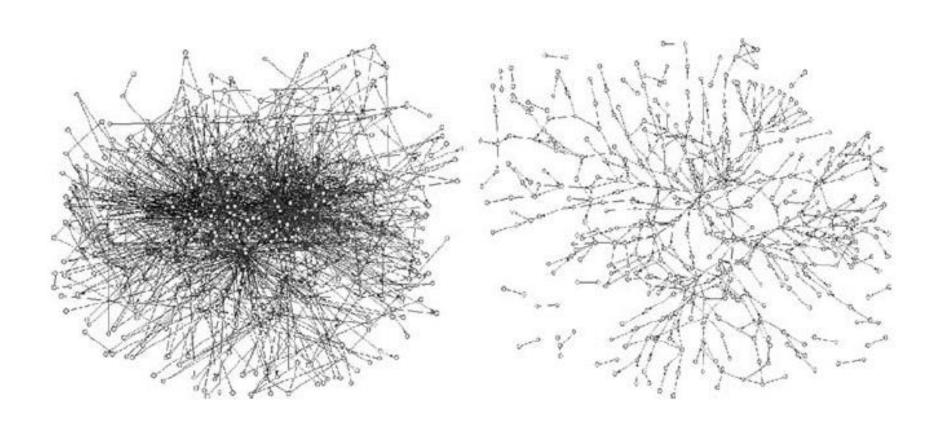

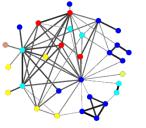

#### Metabolite-centric, Enzyme-centric

# **Currency Metabolites**

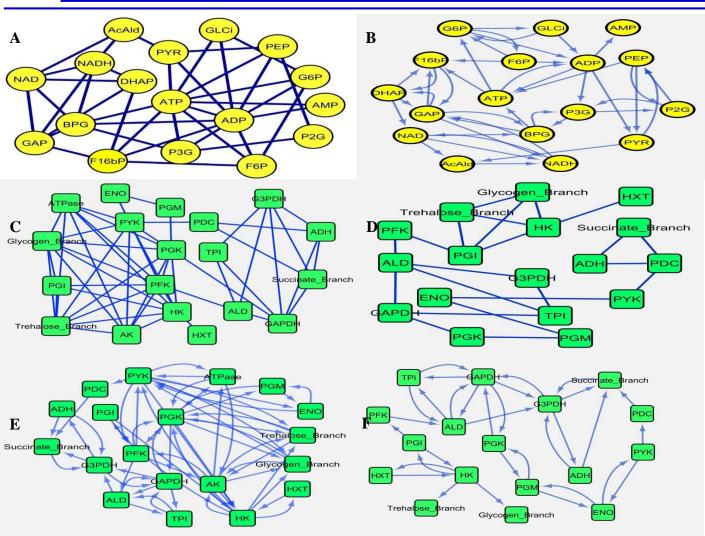

#### Metabolic Network-Example: Glycolysis
